JournEATZ V1 Deployment Manual

JournEATZ V1 Deployment Manual

STEP 1: Upload to GitHub

- Create a new repository on https://github.com (e.g., JournEATZ-Core).

- Upload the contents of JournEATZ_V1.zip to the repo.

STEP 2: Deploy to Vercel

- Go to https://vercel.com and connect your GitHub account.

- Select the JournEATZ repo and click 'Deploy'.

- Vercel will build and host your apps.

STEP 3: Supabase Setup

- Log into https://app.supabase.com and open your project.

- Run the SQL from 'init.v1.sql' to create tables (users, orders, etc).

- Copy your Supabase URL and anon key.

STEP 4: Add Environment Variables

- Open Vercel project > Settings > Environment Variables.

- Use values from 'env.v1.sample'. Add all necessary API keys.

STEP 5: Set Up Replit (Optional)

- Import your GitHub repo to Replit for local development.

- Use Git integration to push changes back to GitHub.

- Changes will auto-deploy via Vercel if configured.

STEP 6: Configure Hostinger DNS

- Add your subdomains (core, driver, marketplace, support) to Hostinger.

- Use CNAME records pointing to your Vercel app URL.

STEP 7: Login to Admin Panel

- Use credentials from 'credentials.v1.txt':

  Email: admin@journeatz.com

Password: JournAdmin2025!!

That's it! You're now running JournEATZ V1 live with full control.
